

Lab 4: Converting DSM to DTM

Student Name: Sushant Bhikaji Gurav

DSM:-

A DSM (Digital Surface Model) captures both the natural and built/artificial features of the environment, as shown below.

DTM:-

A DTM (Digital Terrain Model) typically augments a DEM, by including vector features of the natural terrain, such as rivers and ridges. A DTM may be interpolated to generate a DEM, but not vice versa.

Pre processes:-

- 1) 1st add the data / Photos

2) Go to workflow and click on **Align Photos** next **Build Dense Cloud** next **Build Mesh**

3) The last pre processes is **build DEM**

Processes :-

4) Go to **Tools** → **Dense Cloud** → **Classify Ground Point**

5) Again Go to **Workflow** and click on **Bulid DEM**

6) Then Click on Dense Cloud in workspace

7) Again go **Tools** → **Dense Cloud** → **Filter By class**

8) Here Select the Point classes

9) Again go to Build DEM and select point classes (ground) and click ok

❖ DTM(Digital Terrain Model) →

10) For DSM(Digital Surface Model) Go to **Tools** → **Dense Cloud** → **Filter By class**

11) Select point classes and build DEM

❖ DSM(Digital Surface Model)
